

NC State Dermatology

# Atopic Dermatitis Study

*A new trial to investigate a novel monoclonal antibody drug. The goal is to greatly reduce or eliminate the symptoms of this condition thus improving the dog's quality of life.*

## *Inclusion Criteria*

---

- *Dogs with moderate to severe non-seasonal Atopic Dermatitis (AD)*
- *Food allergy excluded and/or controlled with an appropriate diet*
- *Current on flea and tick prevention for 12 weeks prior to study and for the duration of the study*

## *What the Owner can Expect*

---

- *Patients will be required to come to NCSU for 8 study visits over the course of 14 weeks.*
- *Owners will be required to have multiple phone consults on weeks that in clinic visits are not held.*
- *Owners must closely monitor their dog at home and record in an Owner diary.*

*This study is FULLY FUNDED, including: physical exams, Allergen-specific tests, bloodwork and urinalysis, and 6 doses of the injectable monoclonal antibody drug.*

*For more information, contact Dr. Petra Bizikova*
